Workplace Bundles

A simpler, smarter way to design meeting rooms

Today's workplaces need meeting rooms that are easy to use, easy to support and ready for hybrid work by default. But too often, meeting room technology is designed as individual components rather than a complete experience.

Workplace bundles bring together best-in-class video, audio and collaboration technology into pre-defined room solutions. Instead of designing every room from scratch, organisations can deploy a consistent, scalable standard that delivers reliable performance and a better user experience across every space.

By combining Huddly, Nureva and MAXHUB, workplace bundles remove complexity while improving meeting quality – making it easier to roll out modern collaboration at scale.

What is a workplace bundle?

A workplace bundle is a pre-configured meeting room solution designed around how people actually meet today.

Each bundle combines intelligent video, room-filling audio and intuitive collaboration displays into a single, integrated experience. Bundles are sized for different rooms and use cases, enabling faster deployment, predictable performance and a consistent experience across the entire workplace.

The result is fewer technology choices, less integration risk and meeting rooms that simply work.

Meet the Technology Behind the Bundle

Huddly – Intelligent video that adapts to the room

Huddly cameras are built around on-device AI that automatically frames participants, follows the conversation and adapts to different meeting styles. From compact meeting rooms to large collaborative spaces, Huddly ensures everyone is clearly seen without manual camera control.

By removing complexity for users and IT teams, Huddly helps meetings feel more natural, engaging and inclusive – especially for remote participants.

Nureva – Audio that fills the room, not the table

Nureva's audio systems are designed for modern, flexible meeting spaces. Instead of fixed microphones that dictate where people sit or stand, Nureva provides full-room audio pickup so everyone can be heard clearly from anywhere in the space.

With continuous auto-calibration and minimal components, Nureva reduces installation time and ongoing support while delivering reliable audio for hybrid meetings.

MAXHUB – Simple, powerful collaboration at the front of the room

MAXHUB provides the collaboration foundation for the bundle. Its Microsoft Teams Rooms-enabled displays combine presentation, video, whiteboarding and meeting control into a single, intuitive interface.

With one-touch join and a familiar Teams experience, MAXHUB makes it easy for users to start meetings quickly and confidently – without training or IT intervention.

Why it works better together

Individually, each technology is powerful. Together, they form a complete meeting room experience.

Huddly ensures everyone is seen, Nureva ensures everyone is heard, and MAXHUB ensures meetings are easy to start and collaborate within. Because these technologies are designed to work together as a bundle, organisations benefit from faster deployments, fewer compatibility issues and a consistent experience across every meeting room.

Most importantly, workplace bundles shift meeting rooms from bespoke AV projects to a scalable workplace standard – delivering better meetings today and a platform that evolves with the workplace tomorrow.
